control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is AAV dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophin minigenes, a muscle creatine kinase (MCK) promoter and a small polyA signal sequence. The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression of the dystrophin minigene in operable linkage with an expression of the dystrophin minigene in operable linkage with an expression of the dystrophin minigene with the dystrosmin of the dystrophin minigene with the dystrophin discussion the dystrophin minigene with the dystrophin discussion discuss New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, H1 and H4 domains and a cysteine rich domain of a Example 1; Page 65-66; 71pp; English. dystrophin gene

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified domains, rod repeats, utrophin or a spectrin gene, H1 and H4 invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control control element. The dystrophin minigene in operable linkage with an expression social for treating Duchenne muscular dystrophy (DMD) and Becker muscular dystrophy (BMD) in a mammalian subject The present sequence is human dystrophin minigene delta347 containing nucleotides 1-1992 (N-terminus, finge H1 and rods R1, R2 and R3), 8749-10227 (rod R24, hinge H4 and CR domain) and 11047-11058 (dystrophin last 3 amino acids).
New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, HI and H4 domains and a cysteine rich domain of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 ACAIGCATICAACAICGCCAGAIAICAAITAGGCATAGAGAAACIACIGGAICCIGAAGA 120

P-PSDB; AAY59238

gene encoding a shortened dystrophin - useful for the treatment of muscular dystrophy

Claim 7; Page 16-17; 44pp; Japanese.

having at least one rod repeat structure of hinge 1, hinge 4 and rod and a gene-introducing medium consisting of an adeno-associated virus (AAV) vector or lentivirus vector containing the rod shortened dystrophin immune reaction. The present sequence represents a rod shortened yestrophin The invention provides a gene for the treatment of muscular dystrophy

Sequence 4402 BP; 1329 A; 1000 C; 1019 G; 1054 T; 0 other;

Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. First strand cDNA was primed with a primer [5' KGAGAGAGARAGACTCTTTTTTTTTTTTTTTTTTY 3'], CDNA was prepared by using trebalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. Second

```
Double-stranded cDNA was ligated to ECC RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and ECC RI sites of the modified pT7T3 vector. Library went through one round of normalization, and was constructed by Bento Soares and M. Fatima Bonaldo. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AL641565 XGC-neurula Silurana tropicalis cDNA clone TNeu012d20 5', AL641565 AAL641565.1 GI:16793690
